

SAT Assignment Part 3 – The Final Report

Patrick Koopmann

17/11/2025

Overview

In the research project, you investigate a research question of your choice, based on the sudo encoder and the SAT solver (and possibly different heuristics) that you developed. Details on the project should be clear by now — this was discussed in the lectures and during the Q&A session, where we presented also examples of research questions. This document will say a bit more about the submission, the review process and the grading.

Submission

The deadline for submitting the report is

26 November 2025

You should submit the report at two places: on Canvas as well as on HotCRP, a conferencing platform that is also used for scientific conferences. You can access the platform here:

<https://vu-kr25.hotcrp.com>

Please make sure that **every member of the group is registered** on this platform (best to already do that now and not wait until close to the deadline.). This is needed for the peer reviews. Also, make sure you use your university email so that I will be able to connect the submissions to the submission on Canvas, and later to check that everyone provided their reviews.

Only one person of the group should make the submission.

You will need to submit:

- A PDF file containing your report. Maximally 10 pages excluding references and appendices.
- A zip file with any code used for your experiments. This should be sufficient for reproducing your experiments.

Make sure your submissions are **anonymous**, since you will be reviewed by your peers. At the same time, you should include email addresses and names of all group members in the submission form. Make sure to again use the university email addresses and **double check for spelling mistakes** in both names and email addresses!

The submission on HotCRP will be used for the peer reviewing. In addition, you should upload the PDF to the corresponding assignment on canvas, where a plagiarism check will be run — I will use this assignment to publish the grades for this assignment once I am done with the grading.

Grading and Reviewing

The report will be graded based on the following aspects:

- the general quality of the presentation of the paper, including structure, style and clarity
- the introduction
- the presentation of preliminaries and your implementation(s)
- the tested hypothesis
- the design of the experiment
- the presentation and discussion of the results of the experiment
- the conclusions drawn

These criteria will also be used by your peers, who are in the week following the submission required to review your report.

In particular, every student has to review two papers, and reviews will be assigned randomly via HotCRP. The reviewing will help you develop a critical view on your research, and allow your peers to get some detailed feedback from different perspectives on their submission.

Use of generative AI (ChatGPT, Gemini, DeepSeek, Copilot, etc.) for producing text or code in the submission is forbidden! The same holds for plagiarism — in particular, make sure not to share your code with other groups, as this can lead to your submission being reported as fraud. If you think you have valid reasons to use generative AI, please contact me first.

The deadline for the reviews is **3 December 2025**.
